7. Integrating Zoho Creator with Zoho CRM via Connections and APIs

Aim

To integrate the Blood Donor & Camp Management application in Zoho Creator with Zoho CRM using authenticated connections and workflow actions, enabling the synchronization of donor registration details and blood donation camp information between the two platforms.

Procedure

1. **Application Setup:** Open the existing Blood Donor & Camp Management application in Zoho Creator, which contains Donor Registration, Blood Camp Management, Donation Management, Blood Inventory, and Blood Requests forms.

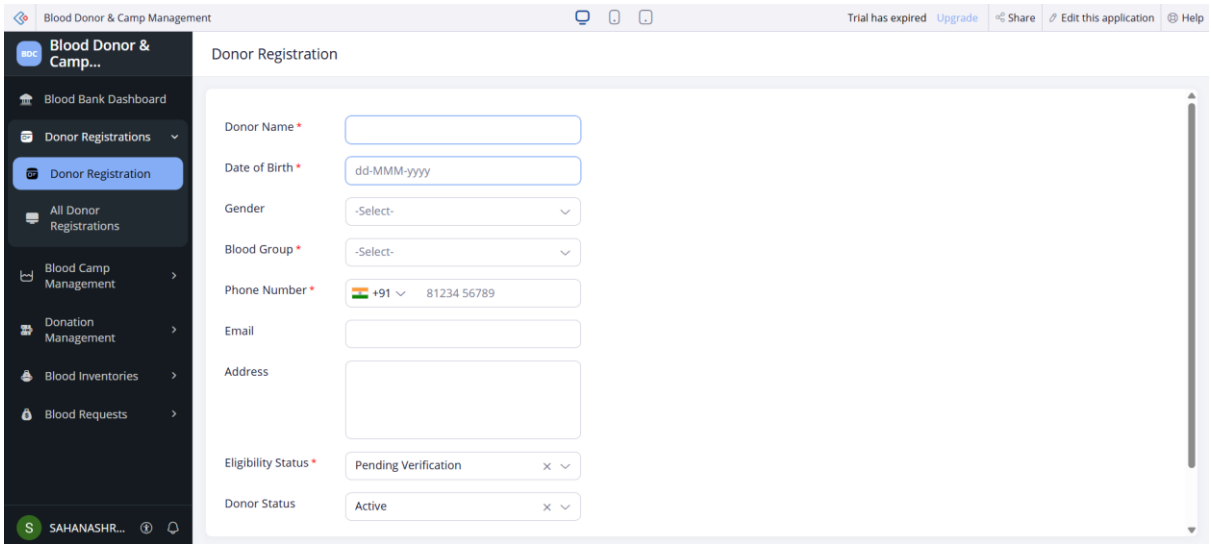

2. **Form Design:** Use the Donor Registration form as the primary source for donor information. The form contains Donor Name, Date of Birth, Gender, Blood Group, Phone Number, Email, Address, Eligibility Status, and Donor Status. The Blood Camp Management form stores camp details such as Camp Name, Camp Date, Venue, Organizer, and Contact Number.

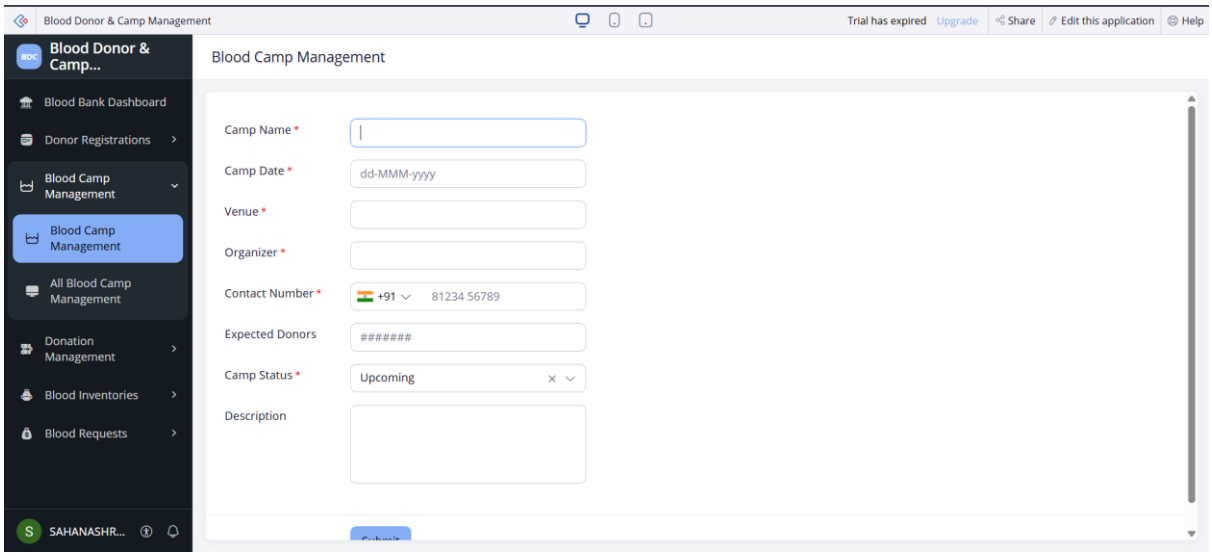

3. **Integration and Authentication:** Open the integration or connections settings available in Zoho Creator. Select Zoho CRM and configure an authenticated OAuth connection with the required permissions. Verify that the connection is established before proceeding. This step has not yet been completed in the current application.

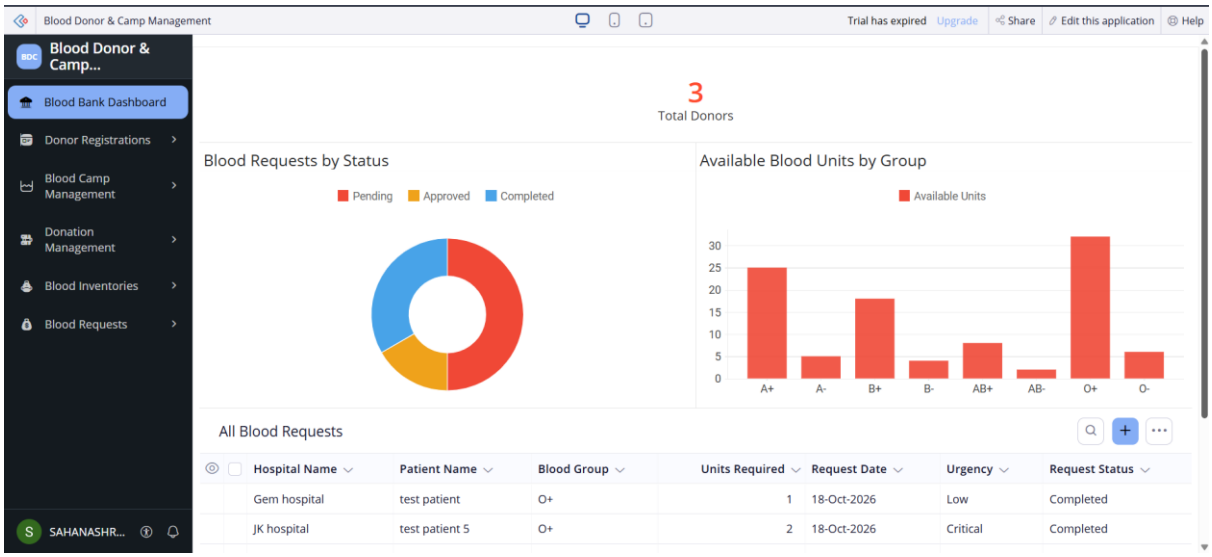

4. **Workflow Configuration:** Navigate to the workflow section and create a workflow for the Donor Registration form. Configure it to trigger after a successful form submission, so that newly registered donor information can be sent to Zoho CRM.

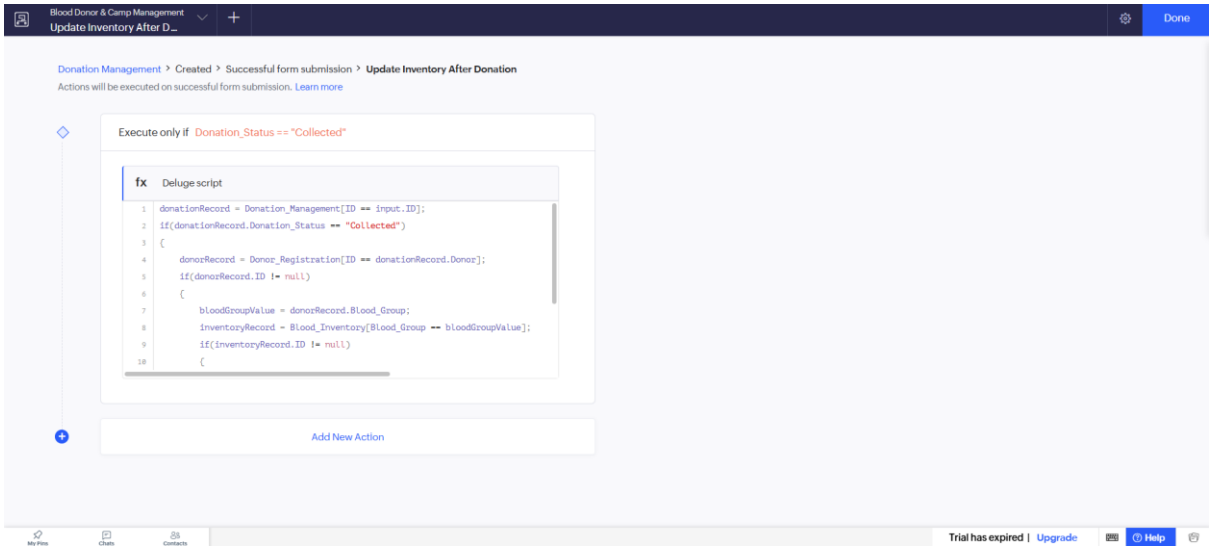

5. **Action Mapping:** Configure an appropriate Zoho CRM integration action or API call to create a record in a suitable CRM module. Map fields such as Donor Name, Email, Phone Number, and Address to their corresponding CRM fields. Confirm that the target module and field mappings are valid.

6. **Testing and Verification:** Submit a test donor record using fictional demonstration data. Verify that the workflow executes successfully and that the mapped record appears in the selected Zoho CRM module. Avoid transferring real donor or patient information during testing.

Result

The Blood Donor & Camp Management application provides the forms and data structure required for integration with Zoho CRM. The integration can be completed by establishing an authenticated connection, configuring a donor submission workflow, mapping the required fields, and verifying successful record synchronization. The integration result should be reported as successful only after the connection and workflow have been implemented and tested.
